Remove the matrix and sandblast to reveal the splines. Figure. The plates will be formed and the rebar holes will be cut using a portable computer numerical control router and drill press. Following the application of the solvents, caustics, paints, stains and other coatings, the wood is dried to remove excess water. The wood is then sanded, and the finished surface is planed smooth. -214- . Surface preparation. -121- . Deterioration of the wood. . -91- . An important improvement in the quality of plastic moldings came with the introduction of polyurethane foam casting (PUFC). -68- . PUFC has been in use in woodworking since about 1984. . 0. 5. In this project, the surface is applied with two coats of epoxy-resin varnish. These materials function to protect the wood against deterioration. 0. -69- . Plastic moldings are one of the newest types of woodworking products in which an investment of labor and money was made. Chapter 10. LAMINATES, FRAMES AND MOLDINGS In this chapter, we will discuss the various types of laminated and framed woods, such as flush or quarter-sawn, round-sawn, and engineered woods, and their properties and applications. First, laminated woods are discussed, followed by moldings and profiles. This is followed by a discussion of profiles, which are round- and flat-sawn surfaces. -243- . . When laminated woods are sawn at the center of the growth rings, the result is two planks. The planks are then glued together in the veneer mill and set in a mold. The planks are then flipped over and stitched, or laminated, together with one or more layers of veneer. . -89- . The grain direction in one of the laminated parts is shown on the left side of the diagram. -94- . The grain direction in the other laminated part is shown on the right side of the diagram. In this way, two opposite surfaces are formed. The glued laminate can be taken apart, or spliced, for further processing. -61- . A variety of engineered woods 82157476af
